

Title: Analytical Solutions for the Two-Level Quantum System Model in Periodontal LLLT

1. Model Overview

The two-level system (TLS) represents a biomolecular chromophore (e.g., cytochrome c oxidase) under low-level laser irradiation. The system is described by a driven, dissipative quantum model with Hamiltonian and Lindblad decoherence.

2. Hamiltonian and Master Equation

In the rotating frame at resonance ($\omega_0 = \omega_L$):

$$H = \frac{\hbar\Omega}{2} \sigma_x$$

The Lindblad master equation with spontaneous emission:

$$\frac{d\rho}{dt} = -\frac{i}{\hbar} [H, \rho] + \gamma(\sigma_- \rho \sigma_+ - \frac{1}{2} \{\sigma_+ \sigma_-, \rho\})$$

3. Steady-State Solution

The excited-state population at steady-state has the exact analytical form:

$$P_e = \langle e | \rho_{ss} | e \rangle = \frac{\Omega^2}{\gamma^2 + 2\Omega^2}$$

Where:

- Ω : Rabi frequency (MHz), proportional to laser irradiance
- γ : Decoherence rate (MHz), representing biological noise
- P_e : Dimensionless excited population ($0 \leq P_e \leq 0.5$)

4. Time-Dependent Coherence Decay

The off-diagonal coherence decays exponentially with time constant:

$$\tau = \frac{2}{\gamma} \text{ (in microseconds for } \gamma \text{ in MHz)}$$

The coherence envelope follows:

$$|C(t)| \approx \frac{\Omega}{2\gamma} \exp\left(-\frac{\gamma t}{2}\right)$$

5. Parameter Ranges Used (Clinical LLLT Context)

- **Rabi frequencies:** $\Omega = 0.05, 0.10, 0.20, 0.50$ MHz
Corresponds to clinical irradiance $\sim 1-100$ mW/cm²

- **Decoherence rates:** $\gamma = 0.05, 0.10, 0.20$ MHz
Models biological noise in periodontal tissues
- **Characteristic rate:** $\Gamma = 1$ MHz
*Sets scaling: 1 normalized time unit = 1 μs *

6. Derived Quantities

From the above formulas:

Table 1 values: $P_e = \Omega^2 / (\gamma^2 + 2\Omega^2)$

Table 2 values:

- Amplitude $A = \Omega / (2\gamma)$
- Decay time $\tau = 2/\gamma$ (μs)

7. Physical Interpretation

- $\Omega > \gamma$: Coherent driving dominates \rightarrow higher P_e
- $\gamma > \Omega$: Decoherence dominates \rightarrow lower P_e
- $\tau = 2/\gamma$: Quantum coherence persists for microseconds under modeled conditions

8. MATLAB/Excel Verification

These formulas can be verified in any computational environment:

- **Excel:** $=\text{Omega}^2 / (\text{Gamma}^2 + 2 * \text{Omega}^2)$
- **MATLAB:** $P_e = \text{Omega}.^2 ./ (\text{Gamma}.^2 + 2 * \text{Omega}.^2)$

Analytical formulas are standard results in quantum optics [and can be verified using the provided reproduction script.
